

Six Sigma Black Belt

Six Sigma Black Belt:

"I believe BP MX will eventually help us become more proactive, however what it's allowing us to do short term is verify the way we manually look at our analysis today, and verify that data short term, and allow us to make the improvements short term. But more proactively, through the confidence in the data of BP MX, it'll allow us to chart a project through Six Sigma to become more proactive in the way we run projects within manufacturing."

"One of the biggest benefits for Six Sigma Black Belt is having the data readily available. Projects prior to BP MX you have to go away and find the data, and you can spend a great deal of time looking for the data and looking for a baseline. With BP MX you have the data at the touch of a fingertip, you can literally go and get in there in the same day, all the baseline data you want, you can pull out of BP MX, and it's really sped up the process of Six Sigma."
