

Health and Safety

Mist Mountain Coalbed Gas Project

Our Commitment

Our goals are simply stated – no accidents, no harm to people, and no damage to the environment. We are committed to abiding by strict safety standards and regulations to protect the welfare of the public, our employees and contractors.

Keeping People Safe and Healthy

Unsafe practices put people, the environment and project success at risk. That's why designing our facilities and planning our activities to preserve public safety at or near our project sites is of utmost importance to BP Canada.

We will ensure through planning, training and drills that employees, contractors and visitors at our sites are well informed, well trained, and committed to safety. We recognize that safe operations depend not only on technically sound operations and processes but on competent people and an active health and safety culture.

BP will work with our employees and contractors to promote health and wellness by identifying and minimizing workplace and personal health risks. This includes ensuring compliance with protective clothing requirements, supplying data on the safe handling of products, conducting ergonomic assessments and providing resources to combat stress, among other initiatives aimed at promoting a healthy lifestyle.

We will conduct regular audits and reviews of our activities to ensure health and safety standards are being met. No activity is so important that it cannot be done safely.

Safety at BP

Safe and reliable operations are BP's number one priority and we have taken a series of actions to improve performance globally. BP's commitment to safety comes from the top as our leaders continue to emphasize the key priority of safe operations for the future of the company. BP strives to protect the personal health and safety of its workforce, recognizing that healthy performance is delivered through healthy people and processes.

Our employees and contractors are trained to take a planned approach to safety so that it becomes part of our culture in the field, the office and at home. It is an important responsibility we all share.

Detailed data on process safety and oil spills, personal safety and driving safety for BP globally can be found on our corporate website: <http://www.bp.com/safety>

Emergency Response

Like every BP project, the Mist Mountain Coalbed Gas Project will include a comprehensive Emergency Response Plan (ERP) to protect workers, people in surrounding areas and the environment.

We will work in cooperation with tenure holders, local authorities, emergency response personnel and the BC Oil and Gas Commission to develop a coordinated ERP. This plan will ensure safe and reasonable access for all users throughout the project area and will include a 24-hour emergency call-in number.

BP Emergency Training vehicle

The Mist Mountain Coalbed Gas Project is a proposal by BP Canada Energy Company (BP) to assess whether natural gas in BC's Crowsnest Coalfield can be produced in a safe, economic and environmentally responsible manner. Our proposal includes up to five years of environmental studies, technical research and consultation prior to a decision on commercial development.
