About this review

For 65 years, the *BP Statistical Review of World Energy* has provided high-quality objective and globally consistent data on world energy markets. The review is one of the most widely respected and authoritative publications in the field of energy economics, used for reference by the media, academia, world governments and energy companies. A new edition is published every June.

Online tools and resources

Key information

All the tables and charts found in the latest printed edition are available at bp.com/statisticalreview plus a number of extras, including:

- Historical data from 1965 for many sections.
- Additional data for refined oil production demand, natural gas, coal, hydroelectricity, nuclear energy, electricity, renewables and CO₂ emissions.
- PDF versions and PowerPoint slide packs of the charts, maps and graphs, plus an Excel workbook of the data.
- Regional and country factsheets.
- Videos and speeches.

Download the BP World Energy app

Explore the world of energy from your tablet or smartphone. Customize charts and perform the calculations. Review the data online and offline. Download the app for free from the Apple App Store and Google play store.

Disclaimer

The data series for proved oil and gas reserves in *BP Statistical Review of World Energy June 2016* does not necessarily meet the definitions, guidelines and practices used for determining proved reserves at company level, for instance, as published by the US Securities and Exchange Commission, nor does it necessarily represent BP's view of proved reserves by country. Rather, the data series has been compiled using a combination of primary official sources and third-party data.

Group chief executive's introduction

Energy in 2015 – slow demand growth amid plentiful supply.

Welcome to the *BP Statistical Review of World Energy*. This is the 65th edition of the Statistical Review, an important milestone for a publication that has traced developments in global energy markets since 1951, a year when coal provided more than half of the world's energy and the price of oil was around \$16 (in today's money). Remarkably, the share of oil in global energy then was almost identical to its share today, at a little over 30%.

We believe the BP Statistical Review contributes to the world's understanding of energy markets by providing timely and objective data to help inform discussions, debates and decision-making. Its annual data helps us better interpret the swings and fluctuations that we are living through, and the historical data provide an important context for gauging where we may be heading next.

This year's edition records the data for 2015, a year in which significant long-term trends in both the global demand and supply of energy came to the fore.

On the demand side, we are seeing a gradual deceleration in global energy consumption as the huge boost from globalization and Chinese industrialization slowly subsides. That slowing was compounded last year by continuing weakness in the global economy. As a result, global primary energy consumption grew by just 1.0% in 2015, similar to the rate of growth seen in 2014, but much slower than the average seen over the past decade. Much of this weakness was driven by China, where energy consumption grew at its slowest rate in almost 20 years. Even so, China remained the world's largest growth market for energy for a fifteenth consecutive year.

The supply of energy in recent years has been driven by different factors, notably technological advances that have increased the range and availability of different fuels. The US shale revolution has unlocked huge swathes of oil and gas resources. And rapid technological gains have supported strong growth in renewable energy, led by wind and solar power. These advances meant that, despite the weakness of energy demand, oil, natural gas and renewable energy all recorded solid growth in 2015. Their gain was at the expense of coal, which saw its largest fall on record, taking its share within primary energy to its lowest level since 2005.

As we know, the contrasting trends in the demand and supply of energy had major effects on energy prices, with oil, gas and coal prices all falling sharply last year. These price declines played a key role in prompting adjustments in energy markets: boosting demand in some markets, most notably oil; curtailing supply and

shifting the fuel mix in others. The extent of this adjustment bodes well for the future stability of our industry.

The combination of slow demand growth and a shift in the fuel mix away from coal towards natural gas and renewable energy had important implications for carbon emissions. In particular, carbon emissions from energy consumption are estimated to have been essentially flat in 2015, the lowest growth in emissions in nearly a quarter of a century, other than in the immediate aftermath of the financial crisis. Last year was of course significant for the UN-led COP21 meetings in Paris and the historic agreement to tackle climate change. BP supports those aims and is committed to playing its part in helping to achieve them. The stalling in the growth of carbon emissions in 2015 is a step in the right direction. But it is only a small step: the scale of the challenge remains substantial, requiring major shifts in both energy efficiency and the fuel mix.

Our industry is living through a period of profound change. But that is nothing new: the past 65 years have seen huge changes to the global energy landscape. Our task as an industry is to take the steps necessary to provide the energy to meet the world's growing demand and ensure our sector remains resilient to the many factors that may buffet us in the near term. We must continue to invest in energy, in all its forms, to meet future needs. That is no easy task and requires fine judgements – judgements that can be more confidently made when based on the kind of solid data and analysis provided by the Statistical Review. The need for BP's Statistical Review over the next 65 years is likely to be just as great as in the past.

Let me conclude by thanking BP's economics team and all those who helped us prepare this review – in particular those in the governments of many countries around the world who have contributed their official data again this year. Thank you for your continuing cooperation and transparency.

Bob Dudley
Group chief executive
June 2016

2015 in review

Growth in global primary energy consumption remained low in 2015; and the fuel mix shifted away from coal towards lower-carbon fuels.

▲ The six-level Puxi Viaduct in Shanghai is one of city's busiest interchanges and is used by thousands of vehicles every hour.

▼ In the UK the National Grid supplies electricity using about 7,200km of power cable line and 690km of underground cable.

Global primary energy consumption increased by just 1.0% in 2015, similar to the below-average growth recorded in 2014 (+1.1%) and well below its 10-year average of 1.9%. Other than the recession of 2009, this represented the lowest global growth since 1998. Consumption growth was below the 10-year average for all regions except Europe & Eurasia; emerging economies accounted for 97% of the increase in global consumption. OECD consumption experienced a small increase, with growth in Europe offsetting declines in the US and Japan. Chinese consumption slowed further, but still recorded the world's largest increment in primary energy consumption for the fifteenth consecutive year. Russia recorded the largest volumetric decline in primary energy consumption. By fuel, only oil and nuclear power grew at above-average rates, with oil gaining global market share for the first time since 1999. Renewables in power generation continued to grow robustly, to nearly 3% of global primary energy consumption, while coal consumption recorded the largest percentage decline on record. Global CO₂ emissions from energy are estimated to have been essentially flat.

Prices for all fossil fuels fell in 2015 for all regions. Crude oil prices recorded the largest decline on record in dollar terms, and the largest percentage decline since 1986. The annual average price for Brent, the international crude oil benchmark,

declined by 47%, reflecting a growing imbalance between global production and consumption. The differential between Brent and the US benchmark West Texas Intermediate (WTI) narrowed to its smallest level since 2010. Natural gas prices fell in all regions, with the largest percentage declines in North America; the US benchmark Henry Hub fell to its lowest level since 1999. Coal prices around the world fell for the fourth consecutive year.

Energy developments

Oil remained the world's leading fuel, accounting for 32.9% of global energy consumption. Although emerging economies continued to dominate the growth in global energy consumption, growth in these countries (+1.6%) was well below its 10-year average of 3.8%.

Emerging economies now account for 58.1% of global energy consumption. Chinese consumption growth slowed to just 1.5%, while India (+5.2%) recorded another robust increase in consumption. OECD consumption increased slightly (+0.1%), compared with an average annual decline of 0.3% over the past decade. A rare increase in EU consumption (+1.6%) more than offset declines in the US (-0.9%) and Japan (-1.2%), where consumption fell to the lowest level since 1991.

+1.0%

Growth of global primary energy consumption, well below the 10-year average of 1.9%.

+1.5%

Growth of Chinese primary energy consumption, the world's largest increment.

+1.9mb/d

Growth of global oil consumption.

32.9%

Oil's share of global energy consumption, the first increase since 1999.

Expanded coverage

Country coverage of refinery throughput and capacity has been expanded. The oil trade tables now break out China and Russia and provide the split of crude oil and oil products for inter-area movements.

▼ The storage tanks, pipes and towers at BP's Rotterdam refinery.

▲ The Valhall platform complex in the Norwegian North Sea, Norway.

Prices

Dated Brent averaged \$52.39 per barrel in 2015, a decline of \$46.56 per barrel from the 2014 level and the lowest annual average since 2004. Crude oil prices rose in early 2015 as global consumption rebounded and US production began to register month-on-month declines. But strong growth in OPEC production, particularly in Iraq and Saudi Arabia, caused prices to fall sharply later in the year. The Brent – WTI differential narrowed for a third consecutive year, to \$3.68 per barrel.

Consumption and production

Global oil consumption grew by 1.9 million barrels per day (b/d), or 1.9% – nearly double the recent historical average (+1%) and significantly stronger than the increase of 1.1 million b/d seen in 2014. The relative strength of consumption was driven by the OECD countries, where consumption increased by 510,000 b/d (+1.1%), compared with an average decline of 1.1% over the past decade. Growth was well above recent historical averages in the US (+1.6%, or 290,000 b/d) and the EU (+1.5%, or 200,000 b/d), while Japan (-3.9%, or -160,000 b/d) recorded the largest decline in oil consumption. Outside of the OECD, net oil importing countries recorded significant increases: China (+6.3%, or +770,000 b/d) once again accounted for the largest increment to demand, while India (+8.1%, or 310,000 b/d) surpassed Japan as the world's third-largest oil consumer. But this was offset by slower growth in oil producers, such that oil demand growth in the non-OECD as a whole (+2.6%, or 1.4 million b/d) was below its recent historical average.

Global oil production increased even more rapidly than consumption for a second consecutive year, rising by 2.8 million b/d or 3.2%, the strongest growth since 2004. Production in Iraq (+750,000 b/d) and Saudi Arabia (+510,000 b/d) rose to

record levels, driving an increase in OPEC production of 1.6 million b/d to 38.2 million b/d, exceeding the previous record reached in 2012. Production outside OPEC slowed from last year's record growth but still grew by 1.3 million b/d. The US (+1 million b/d) had the world's largest annual growth increment and remained the world's largest oil producer. Elsewhere, production growth in Brazil (+180,000 b/d), Russia (+140,000 b/d), the UK and Canada (+110,000 b/d each) was offset by declines in Mexico (-200,000 b/d, the world's largest decline), Yemen (-100,000 b/d) and elsewhere.

Refining and trade

Global crude runs rose by 1.8 million b/d (+2.3%), more than triple their 10-year average growth, despite declines in South & Central America, Africa and Russia. Strong refining margins lifted crude runs by 1 million b/d in the OECD, with growth in Europe (+740,000 b/d) the highest since 1986. In contrast, global refining capacity grew by only 450,000 b/d, the smallest increase in 23 years. Delayed expansion in China, combined with closures in Taiwan and Australia, resulted in a fall in Asian capacity for the first time since 1988. Global refinery utilization rose by 1 percentage point to 82.1%, the fastest increase in five years.

After barely growing in 2014, global trade of crude oil and refined products expanded by 3 million b/d (+5.2%) last year, the largest increase since 1993. Crude oil trade was lifted by growing exports from the Middle East (+550,000 b/d), while Europe and China accounted for the largest increases in imports (+770,000 b/d and +530,000 b/d respectively). Growth in refined product exports was again led by the US (+470,000 b/d); the country's net oil imports fell to 4.8 million b/d, the lowest since 1985.

🔥 Natural gas

🏠 Coal

+5.4%

Growth of US gas production, the world's largest increment.

-1.8%

Decline in global coal consumption, the largest on record.

Gas

Consumption and production

World natural gas consumption grew by 1.7% in 2015, a significant increase from the very weak growth (+0.6%) seen in 2014 but still below the 10-year average of 2.3%. As with oil, consumption growth was below average outside the OECD (+1.9%, accounting for 53.5% of global consumption) but above average in the OECD countries (+1.5%). Among emerging economies, Iran (+6.2%) and China (+4.7%) recorded the largest increments to consumption, even though growth in China was sluggish compared with a 10-year average growth of 15.1%. Meanwhile, Russia (-5%) recorded the largest volumetric decline, followed by the Ukraine (-21.8%). Among OECD countries, the US (+3%) accounted for the largest growth increment, while EU consumption (+4.6%) rebounded after a large decline in 2014. Globally, natural gas accounted for 23.8% of primary energy consumption.

Global natural gas production grew by 2.2%, more rapidly than consumption but below its 10-year average of 2.4%. As with consumption, the US (+5.4%) recorded the largest growth increment, with Iran (+5.7%) and Norway (+7.7%) also recording significant increases in production. Growth was above average in North America, Africa, and Asia Pacific. EU production once again fell sharply (-8%), with the Netherlands (-22.8%) recording the world's largest decline. Large volumetric declines were also seen in Russia (-1.5%) and Yemen (-71.5%).

Trade

Global natural gas trade rebounded in 2015, rising by 3.3%. Pipeline shipments increased by 4%, driven by growth in net pipeline exports from Russia (+7.7%) and Norway (+7%). The largest volumetric increases in net pipeline imports were in Mexico (+44.9%) and France (+28.8%). Global LNG trade increased by 1.8%. Export growth was led by Australia (+25.3%) and Papua New Guinea (+104.8%), offsetting declines in shipments from Yemen (-77.2%). Higher net LNG imports for Europe (+15.9%) and rising Middle Eastern imports (+93.8%) were partly offset by declines in net imports in South Korea (-10.4%) and Japan (-4%). International natural gas trade accounted for 30.1% of global consumption; the pipeline share of global gas trade rose to 67.5%.

Coal

Global coal consumption fell by 1.8% in 2015, well below the 10-year average annual growth of 2.1% and the largest percentage (and volumetric) decline in our data set. All of the net decline was accounted for by the US (-12.7%, the world's largest volumetric decline) and China (-1.5%), partially offset by modest increases in India (+4.8%) and Indonesia (+15%). Global coal production fell by 4%, with large declines in the US (-10.4%), Indonesia (-14.4%), and China (-2%). Coal's share of global primary energy consumption fell to 29.2%, the lowest share since 2005.

Other fuels

▲ Sugar cane reception, preparation and juice extraction facilities at BP Biofuels' Ituiutaba plant in Brazil.

▼ Wind turbines at the Goshen wind farm in Idaho Falls, Idaho.

Nuclear and hydroelectric

Global nuclear output grew by 1.3%, with China (+28.9%) accounting for virtually all of the increase. China has passed South Korea to become the fourth-largest supplier of nuclear power. Elsewhere, increases in Russia (+8%) and South Korea (+5.3%) offset declines in Sweden (-12.6%) and Belgium (-22.6%). EU output (-2.2%) fell to the lowest level since 1992. Nuclear power accounted for 4.4% of global primary energy consumption.

Global hydroelectric output grew by a below average 1%, compared with a 10-year average of 3%. China (+5%) remains by far the world's largest producer of hydroelectricity; as with nuclear power, China accounted for all of the net global increase, even though growth in percentage terms was less than half the recent historical average. Elsewhere, growth in Turkey (+64.6%, following a very weak 2014) and Scandinavia was offset by drought conditions in Italy, Spain and Portugal (-28.6% combined) and Brazil (-3.3%). Hydroelectric output accounted for 6.8% of global primary energy consumption.

Renewables

Renewable energy sources in power generation continued to increase in 2015, reaching 2.8% of global energy consumption, up from 0.8% a decade ago.

Renewable energy used in power generation grew by 15.2%, slightly below the 10-year average growth of 15.9% but a record increment (+213 terawatt-hours), which was roughly equal to all of the increase in global power generation. Renewables accounted for 6.7% of global power generation. China (+20.9%) and Germany

(+23.5%) recorded the largest increments in renewables in power generation. Globally, wind energy (+17.4%) remains the largest source of renewable electricity (52.2% of renewable generation), with Germany (+53.4%) recording the largest growth increment. Solar power generation grew by 32.6%, with China (+69.7%), the US (+41.8%) and Japan (+58.6%) accounting for the largest increases. China overtook Germany and the US to become the world's top generator of solar energy. Global biofuels production grew by just 0.9%, well below the 10-year average of 14.3%: Brazil (+6.8%) and the US (+2.9%) accounted for essentially all of the net increase, partly offset by large declines in Indonesia (-46.9%) and Argentina (-23.9%).

Carbon dioxide emissions

Emissions of CO₂ from energy consumption increased by only 0.1% in 2015. Other than the recession of 2009, this represented the lowest growth rate since 1992. This encouraging outcome was driven by a combination of slightly slower energy consumption growth and a shift in the global fuel mix (with lower global coal consumption partly offset by growth in natural gas and non-fossil fuels). Emissions growth was below average in every region except Europe & Eurasia. The US (-2.6%) and Russia (-4.2%) accounted for the largest absolute declines in emissions, while India (+5.3%) saw the largest increase. Chinese emissions declined for the first time since 1998. This year's estimates on CO₂ emissions reflect a more detailed breakdown of fuel consumption by product type, as well as allowances for non-combusted hydrocarbons. See bp.com/statisticalreview for a detailed explanation of the revised methodology.

+213

 terawatt-hours

Growth in renewable power generation, the largest increment on record.

+0.1%

Increase in global CO₂ emissions from fossil fuel use.

In detail

Additional information – including historical time series for the fuels reported in this review; further detail on renewable forms of energy; oil consumption by product; electricity generation; and CO₂ emissions from energy use – is available at bp.com/statisticalreview

#Excludes Estonia and Latvia in 2005.

Notes: Total proved reserves of oil – Generally taken to be those quantities that geological and engineering information indicates with reasonable certainty can be recovered in the future from known reservoirs under existing economic and operating conditions. The data series for total proved oil does not necessarily meet the definitions, guidelines and practices used for determining proved reserves at company level, for instance as published by the US Securities and Exchange Commission, nor does it necessarily represent BP's view of proved reserves by country.

Reserves-to-production (R/P) ratio – If the reserves remaining at the end of any year are divided by the production in that year, the result is the length of time that those remaining reserves would last if production were to continue at that rate.

Source of data – The estimates in this table have been compiled using a combination of primary official sources, third-party data from the OPEC Secretariat, World Oil, Oil & Gas Journal and independent estimates of Russian reserves based on official data and Chinese reserves based on information in the public domain.

Canadian oil sands 'under active development' are an official estimate. Venezuelan Orinoco Belt reserves are based on the OPEC Secretariat and government announcements.

Reserves include gas condensate and natural gas liquids (NGLs) as well as crude oil.

Shares of total and R/P ratios are calculated using thousand million barrels figures.

Reserves-to-production (R/P) ratios

Years

2015 by region

History

Global proved oil reserves in 2015 fell by 2.4 billion barrels (-0.1%) to 1697.6 billion barrels, just the second annual decline in our data set (along with 1998). Reserves have nonetheless increased by 24%, or 320 billion barrels, over the past decade; and are sufficient to meet 50.7 years of global production. Brazil recorded the largest decline, with proved reserves falling by 3.2 billion barrels, while Norwegian proved reserves grew by 1.5 billion barrels. OPEC countries continue to hold the largest share (71.4%) of global proved reserves. On a regional basis, South & Central American reserves have the highest R/P ratio, 117 years. Lags in reporting official data mean that 2015 figures for many countries are not yet available.

Distribution of proved reserves in 1995, 2005 and 2015

*Inland demand plus international aviation and marine bunkers and refinery fuel and loss. Consumption of biogasoline (such as ethanol), biodiesel and derivatives of coal and natural gas are also included.

♦Less than 0.05%.

Notes: Differences between these world consumption figures and world production statistics are accounted for by stock changes, consumption of non-petroleum additives and substitute fuels, and unavoidable disparities in the definition, measurement or conversion of oil supply and demand data.

Annual changes and shares of total are calculated using million tonnes per annum figures.

Oil: Production in million tonnes*

*Inland demand plus international aviation and marine bunkers and refinery fuel and loss. Consumption of biogasoline (such as ethanol), biodiesel and derivatives of coal and natural gas are also included.

•Less than 0.05%.

Note: Differences between these world consumption figures and world production statistics are accounted for by stock changes, consumption of non-petroleum additives and substitute fuels, and unavoidable disparities in the definition, measurement or conversion of oil supply and demand data.

Oil: Production by region

Million barrels daily

Oil: Consumption by region

Million barrels daily

World oil production growth in 2015 significantly exceeded the growth in oil consumption for a second consecutive year. Production grew by 2.8 million b/d, led by increases in the Middle East (+1.5 million b/d) and North America (+0.9 million b/d). Global oil consumption increased by 1.9 million b/d, nearly double the 10-year average, with above-average growth driven by OECD countries. The Asia Pacific region accounted for 74% of global growth, with China once again contributing the largest national increment to global oil consumption growth (+770,000 b/d).

Notes: Annual changes and shares of total are calculated using thousand barrels daily figures.

'Light distillates' consists of aviation and motor gasolines and light distillate feedstock (LDF).

'Middle distillates' consists of jet and heating kerosenes, and gas and diesel oils (including marine bunkers).

'Fuel oil' includes marine bunkers and crude oil used directly as fuel.

'Others' consists of refinery gas, liquefied petroleum gas (LPG), solvents, petroleum coke, lubricants, bitumen, wax, other refined products and refinery fuel and loss.

An extended breakdown of oil consumption by product group is available at bp.com/statisticalreview

Crude oil prices 1861-2015

US dollars per barrel

World events

Oil product prices (Rotterdam)

US dollars per barrel

Product differentials to crude (Rotterdam products minus Dated Brent)

US dollars per barrel

Regional refining margins

US dollars per barrel

Note: The refining margins presented are benchmark margins for three major global refining centres: US Gulf Coast (USGC), North West Europe (NWE – Rotterdam) and Singapore. In each case they are based on a single crude oil appropriate for that region and have optimized product yields based on a generic refinery configuration (cracking, hydrocracking or coking), again appropriate for that region. The margins are on a semi-variable basis, i.e. the margin after all variable costs and fixed energy costs.

Refinery utilization

Percentage (based on average annual capacity)

Global crude runs rose by 1.8 million b/d in 2015, led by Europe and China. Europe recorded its largest increase in crude runs since 1986. Global refining capacity growth slowed to 450,000 b/d, the lowest in 23 years. Capacity in Asia Pacific fell for the first time since 1988. Global average refinery utilization rose by 1% to 82.1%, the fastest increase in 5 years.

†Excludes Japan. Excludes trade between other Asia Pacific countries and India prior to 2007.

North and West African exports excludes intra-Africa trade.

Note: Annual changes and shares of total are calculated using thousand barrels daily figures.

n/a not available.

Notes: Proved reserves of natural gas – Generally taken to be those quantities that geological and engineering information indicates with reasonable certainty can be recovered in the future from known reservoirs under existing economic and operating conditions. The data series for total proved natural gas reserves does not necessarily meet the definitions, guidelines and practices used for determining proved reserves at a company level, for instance as published by the US Securities and Exchange Commission, nor does it necessarily represent BP's view of proved reserves by country.

Reserves-to-production (R/P) ratio – If the reserves remaining at the end of any year are divided by the production in that year, the result is the length of time that those remaining reserves would last if production were to continue at that rate.

Source of data – The estimates in this table have been compiled using a combination of primary official sources and third-party data from Cedigaz and the OPEC Secretariat.

Reserves-to-production (R/P) ratios

Years

2015 by region

History

As was the case for oil, global proved natural gas reserves in 2015 fell slightly, (by 0.1 trillion cubic metres (tcm), or -0.1%) to 186.9 tcm, sufficient to meet 52.8 years of current production. Small declines in Russian and Norwegian reserves drove the decline. Reserves have increased by 29.6 tcm over the past decade. The Middle East region holds the largest proved reserves (80 tcm, 42.8% of the global total), and has the highest regional R/P ratio (129.5 years). Lags in reporting official data mean that 2015 figures for many countries are not yet available.

Distribution of proved reserves in 1995, 2005 and 2015

Percentage

- Middle East
- Europe & Eurasia
- Asia Pacific

*Excludes gas flared or recycled. Includes natural gas produced for Gas-to-Liquids transformation.

Source: Includes data from Cedigaz.

♦Less than 0.05%.

Notes: As far as possible, the data above represents standard cubic metres (measured at 15°C and 1013 mbar); as they are derived directly from tonnes of oil equivalent using an average conversion factor, they do not necessarily equate with gas volumes expressed in specific national terms.

Annual changes and shares of total are calculated using million tonnes of oil equivalent figures.

Natural gas production data expressed in billion cubic feet per day is available at bp.com/statisticalreview

Natural gas: Consumption in billion cubic metres*

*Excludes natural gas converted to liquid fuels but includes derivatives of coal as well as natural gas consumed in Gas-to-Liquids transformation.

Source: Includes data from Cedigaz.

♦Less than 0.05%.

Notes: As far as possible, the data above represents standard cubic metres (measured at 15°C and 1013 mbar); as they are derived directly from tonnes of oil equivalent using an average conversion factor, they do not necessarily equate with gas volumes expressed in specific national terms.

The difference between these world consumption figures and the world production statistics is due to variations in stocks at storage facilities and liquefaction plants, together with unavoidable disparities in the definition, measurement or conversion of gas supply and demand data.

Annual changes and shares of total are calculated using million tonnes of oil equivalent figures.

Natural gas consumption data expressed in billion cubic feet per day is available at bp.com/statisticalreview

*Excludes natural gas converted to liquid fuels but includes derivatives of coal as well as natural gas consumed in Gas-to-Liquids transformation.

Source: Includes data from Cedigaz.

♦Less than 0.05%.

Note: The difference between these world consumption figures and the world production statistics is due to variations in stocks at storage facilities and liquefaction plants, together with unavoidable disparities in the definition, measurement or conversion of gas supply and demand data.

Natural gas: Production by region

Billion cubic metres

Natural gas: Consumption by region

Billion cubic metres

World natural gas production growth accelerated to 2.2% in 2015, slightly below the 10-year average growth of 2.4%. North America (+3.9%) recorded the largest growth increment, driven by continued strong increases in US output, while production in Europe & Eurasia declined by 0.7%, with large declines in the Netherlands and Russia. Consumption growth (+1.7%) also accelerated from a very weak 2014, but remained below the 10-year average of 2.3%. The Middle East recorded the strongest regional growth rate (+6.2%), while consumption in Europe & Eurasia declined by 0.3%, with a decline in Russia offsetting growth in the EU.

Source of reserves data: World Energy Resources 2013 Survey, World Energy Council.

Notes: Total proved reserves of coal – Generally taken to be those quantities that geological and engineering information indicates with reasonable certainty can be recovered in the future from known reservoirs under existing economic and operating conditions. The data series for total proved coal reserves does not necessarily meet the definitions, guidelines and practices used for determining proved reserves at company level, for instance as published by the US Securities and Exchange Commission, nor does it necessarily represent BP's view of proved reserves by country.

Reserves-to-production (R/P) ratio – If the reserves remaining at the end of any year are divided by the production in that year, the result is the length of time that those remaining reserves would last if production were to continue at that rate.

Reserves-to-production (R/P) ratios are calculated excluding other solid fuels in reserves and production.

‡Source: Platts. Prices are for Central Appalachian 12,500 BTU, 1.2 SO₂ coal, fob. Prices for 1995-2000 are by coal price publication date, 2001-2015 by coal price assessment date.

Note: cif = cost+insurance+freight (average prices); fob = free on board.

Reserves-to-production (R/P) ratios

Years

2015 by region

History

World proved coal reserves in 2015 were sufficient to meet 114 years of global production, by far the largest R/P ratio for any fossil fuel. By region, Europe & Eurasia holds the largest proved reserves while North America has the highest R/P ratio – 276 years. The Asia Pacific region holds the second-largest reserves, but higher rates of production – accounting for 70.6% of global output – leave it with the lowest regional R/P ratio (53 years).

Distribution of proved reserves in 1995, 2005 and 2015

*Commercial solid fuels only, i.e. bituminous coal and anthracite (hard coal), and lignite and brown (sub-bituminous) coal, and other commercial solid fuels. Excludes coal converted to liquid or gaseous fuels, but includes coal consumed in transformation processes.

†Less than 0.05.

♦Less than 0.05%.

Note: Differences between these world consumption figures and the world production statistics are accounted for by stock changes, and unavoidable disparities in the definition, measurement or conversion of coal supply and demand data.

Coal: Production by region

Million tonnes oil equivalent

Coal: Consumption by region

Million tonnes oil equivalent

World production and consumption of coal declined in 2015, by 4% and 1.8%, respectively. Production fell for the first time since 1998, with large declines in Asia Pacific (-2.9%) and North America (-10.3%). China remained by far the world's largest producer even though output fell by 2%. Coal consumption declined in all regions except South & Central America and Asia Pacific. The US and China accounted for all of the net decline in global consumption.

Note: Hydroelectricity data expressed in terawatt-hours is available at bp.com/statisticalreview

Nuclear energy consumption by region

Million tonnes oil equivalent

Hydroelectricity consumption by region

Million tonnes oil equivalent

World nuclear power generation increased by 1.3% in 2015, well above the 10-year average of -0.7%. The Asia Pacific region accounted for all of the net increase, driven by growth in China (+28.9%), which passed South Korea to become the world's fourth-largest producer of nuclear power. World hydroelectric output grew by a below-average 1%, with the Asia Pacific region again accounting for all of the net growth, even though the region's growth was just over half the 10-year average.

Other renewables consumption by region

Million tonnes oil equivalent

Other renewables share of power generation by region

Percentage

Renewable energy in power generation grew by 15.2%, slightly below the 10-year average growth rate, but the largest increment on record (+48 mtoe). Globally, wind provided the largest growth increment (+28 mtoe), but solar had the highest growth rate (+32.6%). Regionally, Europe & Eurasia and Asia Pacific provided the largest growth increments (+18.8 mtoe and 17.5 mtoe, respectively). Non-hydro renewable energy accounted for 6.7% of global power generation in 2015, up from 2% a decade ago. The Europe & Eurasia region has the highest share of power from renewables, at 11.9% (reaching 18.6% in the EU).

Note: Consumption of fuel ethanol and biodiesel is included in oil consumption tables.

Source: Includes data from F.O. Lichts; US Energy Information Administration.

World biofuels production

Million tonnes oil equivalent

World biofuels production increased by 0.9% in 2015, the slowest rate of growth since output declined in 2000. Global ethanol production increased by 4.1%, the third consecutive year of growth, led by increases from Asia Pacific, South & Central America, and North America. Biodiesel production declined by 4.9% in 2015, with output declining in all of the major producing regions.

*In this review, primary energy comprises commercially-traded fuels, including modern renewables used to generate electricity.

†Less than 0.05.

Note: Oil consumption is measured in million tonnes; other fuels in million tonnes of oil equivalent.

World consumption

Million tonnes oil equivalent

World primary energy consumption grew by a below-average 1.0% in 2015, the slowest rate of growth since 1998 (other than the decline in the aftermath of the financial crisis). Growth was below average in all regions except Europe & Eurasia. All fuels except oil and nuclear power grew at below-average rates. Oil remains the world's dominant fuel and gained global market share for the first time since 1999, while coal's market share fell to the lowest level since 2005. Renewables in power generation accounted for a record 2.8% of global primary energy consumption.

Regional consumption by fuel 2015

Percentage

Oil remains the dominant fuel in Africa and the Americas, while natural gas dominates in Europe & Eurasia and the Middle East. Coal is the dominant fuel in the Asia Pacific region, accounting for 51% of regional energy consumption – the highest share of any fuel for any region. Europe & Eurasia is the only region with no fuel reaching one-third of the total energy mix. The Middle East has the least diverse fuel mix, with oil and gas combined accounting for 98% of energy consumption.

Fuel consumption by region 2015

Percentage

Asia Pacific is the leading consumer of oil, coal, and hydroelectricity, while Europe & Eurasia is the leading consumer of natural gas, nuclear power, and renewables in power generation. Asia Pacific dominates global coal consumption, accounting for 72.9% of global consumption. Natural gas is the only fuel for which no region accounts for more than 30% of global consumption (with Europe & Eurasia accounting for 28.8% of global consumption).

Fossil fuel reserves-to-production (R/P) ratios at end 2015

Years

Coal remains – by far – the most abundant fossil fuel by R/P ratio; oil and natural gas reserves have increased over time, although both registered small declines in 2015. Non-OECD countries account for the majority of proved reserves for all fossil fuels. The Middle East holds the largest reserves for oil and natural gas, and the highest R/P ratio for natural gas; South & Central America holds the highest R/P ratio for oil. Europe & Eurasia holds the largest coal reserves and North America has the highest R/P ratio.

Definitions

Statistics published in this review are taken from government sources and published data. No use is made of confidential information obtained by BP in the course of its business.

Country and geographic groupings are made purely for statistical purposes and are not intended to imply any judgement about political or economic standings.

North America

US (excluding US territories), Canada, Mexico.

South & Central America

Caribbean (including Puerto Rico and US Virgin Islands), Central and South America.

Europe

European members of the OECD plus Albania, Bosnia-Herzegovina, Bulgaria, Croatia, Cyprus, The former Yugoslav Republic of Macedonia, Georgia, Gibraltar, Latvia, Lithuania, Malta, Montenegro, Romania and Serbia.

Commonwealth of Independent States (CIS)

Armenia, Azerbaijan, Belarus, Kazakhstan, Kyrgyzstan, Moldova, Russian Federation, Tajikistan, Turkmenistan, Ukraine, Uzbekistan.

Europe & Eurasia

All countries listed above under the headings Europe and CIS.

Middle East

Arabian Peninsula, Iran, Iraq, Israel, Jordan, Lebanon, Syria.

North Africa

Territories on the north coast of Africa from Egypt to western Sahara.

West Africa

Territories on the west coast of Africa from Mauritania to Angola, including Cape Verde, Chad.

East and Southern Africa

Territories on the east coast of Africa from Sudan to Republic of South Africa. Also Botswana, Madagascar, Malawi, Namibia, Uganda, Zambia, Zimbabwe.

Asia Pacific

Brunei, Cambodia, China, China Hong Kong SAR*, China Macau SAR*, Indonesia, Japan, Laos, Malaysia, Mongolia, North Korea, Philippines, Singapore, South Asia (Afghanistan, Bangladesh, India, Myanmar, Nepal, Pakistan, Sri Lanka), South Korea, Taiwan, Thailand, Vietnam, Australia, New Zealand, Papua New Guinea, Oceania.

*Special Administrative Region.

Australasia

Australia, New Zealand.

OECD members

Europe: Austria, Belgium, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Luxembourg, Netherlands, Norway, Poland, Portugal, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey, UK.

Other member countries: Australia, Canada, Chile, Israel, Japan, Mexico, New Zealand, South Korea, US.

OPEC members

Middle East: Iran, Iraq, Kuwait, Qatar, Saudi Arabia, United Arab Emirates.

North Africa: Algeria, Libya.

West Africa: Angola, Nigeria.

South America: Ecuador, Venezuela.

Units

1 metric tonne	= 2204.62lb
	= 1.1023 short tons
1 kilolitre	= 6.2898 barrels
	= 1 cubic metre
1 kilocalorie (kcal)	= 4.187kJ
	= 3.968Btu
1 kilojoule (kJ)	= 0.239kcal
	= 0.948Btu
1 British thermal unit (Btu)	= 0.252kcal
	= 1.055kJ
1 kilowatt-hour (kWh)	= 860kcal
	= 3600kJ
	= 3412Btu

Calorific equivalents

One tonne of oil equivalent equals approximately:

Heat units	10 million kilocalories
	42 gigajoules
	40 million British thermal units
Solid fuels	1.5 tonnes of hard coal
	3 tonnes of lignite
Gaseous fuels	See Natural gas and liquefied natural gas table
Electricity	12 megawatt-hours

One million tonnes of oil or oil equivalent produces about 4400 gigawatt-hours (= 4.4 terawatt-hours) of electricity in a modern power station.

1 barrel of ethanol = 0.57 barrel of oil

1 barrel of biodiesel = 0.88 barrel of oil

European Union members

Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, UK.

Non-OECD

All countries that are not members of the OECD.

Methodology

The primary energy values of nuclear and hydroelectric power generation, as well as electricity from renewable sources, have been derived by calculating the equivalent amount of fossil fuel required to generate the same volume of electricity in a thermal power station, assuming a conversion efficiency of 38% (the average for OECD thermal power generation).

Fuels used as inputs for conversion technologies (gas-to-liquids, coal-to-liquids and coal-to-gas) are counted as production for the source fuel and the outputs are counted as consumption for the converted fuel.

Percentages

Calculated before rounding of actuals. All annual changes and shares of totals are on a weight basis except on pages 6, 13, 16, 17, 18 and 20.

Rounding differences

Because of rounding, some totals may not agree exactly with the sum of their component parts.

Tonnes

Metric equivalent of tons.
