

Michigan

We're powering Michigan with retail fuel stations, truck stops and a plant that recently began producing renewable natural gas (RNG) from a landfill near Detroit.

We have more than 600 bp-branded retail stations and six TravelCenters of America truck stops across the state.

Innovative renewable energy production

Archaea Energy, bp's biogas business, recently brought online a plant in Canton that turns landfill waste emissions into RNG. The facility can produce 3,500 standard cubic feet per minute (scfm) of RNG, enough to heat more than 14,000 homes annually, according to the EPA's Landfill Gas to Energy Benefits Calculator. It is located at the Sauk Hills Landfill outside Detroit and is one of 40 Archaea sites nationally with Republic Services, our largest landfill partner.

Regional partnership

Additionally, bp is collaborating with Michigan as part of the Midwest Alliance for Clean Hydrogen, a coalition the US Department of Energy tapped to develop a regional low carbon hydrogen hub with federal support.
